

Assessment

MARKET ACCESS

Globalization is rapidly modifying the manufacturing sector and the competitive environment, in which companies are increasingly required to operate, is affected by widespread and structural changes that require major adaptability.

One of the key assets for economic recovery is access to international markets.

Manufacturers of machinery, electrical equipment and systems must have a thorough knowledge of the rules of export, with particular reference to technical standards, laws and certifications required in various countries, but the language difficulties, the lack of homogeneity and complexity of the regulations and the limited availability of information and adequate assistance, are now the greatest obstacles to the implementation of this process.

The experts provide the companies with a detailed knowledge of the requirements and regulations applicable in each reference market so that preventive and corrective actions can be taken and improvements can be made to the products to be placed on foreign markets from the early stages of their product life cycle.

This technical support, for the manufacturer, is a guarantee of the conformity of the products themselves avoiding unnecessary waste of time and money related to their review.

Electrical & Machine Safety (EMS) services are provided to meet the export needs of the world's most industrialized regions such as Europe, North America, South America, Eurasia, Arab countries, Australia, South Africa, China, Japan, India and Korea.
